

**Eskom Power Station Exceedances of
Applicable Atmospheric Emission License (AEL) Limit Values for
PM, SO₂ & NO_x During
April 2016 to December 2017**

UPDATED MARCH 22, 2019

**Dr. Ranajit (Ron) Sahu, Ph.D., QEP, CEM
Consultant, Energy & Air Quality Issues
Alhambra, CA**

Notes on the update: This study was originally issued in November 2018 with analysis hampered by several missing reports. After discussions with Eskom and others these reports were received on February 28, 2019. While Eskom took issue with the findings of the November 2018 report, it has not yet provided any evidence that the findings were incorrect. In fact, it confirmed that significant dust issues have persisted at Kendal, one of the largest power stations in South Africa, throughout 2018. My updated study shows that Eskom self-reported over 3,217 exceedances of AEL limits in the 21-month period between April 2016 and December 2017. This is an increase of 36 compared to the 3,181 exceedances tallied previously. I continue to await corrected reports from 2016-2017, and all of the monthly reports from 2018. I intend to update this analysis to include 2018 as soon as that data becomes available.

Summary

I reviewed hardcopy monthly monitoring reports from 17 Eskom coal and gas power stations over a 21-month study period (April 2016 through December 2017). Based on my review, and after excluding the gas plants due to incomplete data, I determined that the 14 operating coal fired power stations reported 3,217 exceedances of applicable daily Atmospheric Emissions Licenses (AEL) limits for particulate matter (PM), sulfur oxides (SO₂), and oxides of nitrogen (NO_x). The most

frequent exceedances occurred at Lethabo (PM and NO_x), Matla (NO_x), Matimba (SO₂), Kriel (PM), Duvha (PM), and Kendal (PM).

For reasons explained below, my conclusions are conservative and may underestimate the true scope of the problem because I did not have access to clear and comprehensive data, and had to exclude clearly erroneous or repetitive reports (which combined would have added 49 exceedances from repetitive reporting, and 114 from erroneous reports).

The opinions provided in this report are based on my education, professional training, and twenty-eight years of experience in air pollution consulting and engineering, on behalf of clients in the private and public sector in the United States and internationally. Details of my experience are provided in my vitae provided in Attachment A.

Methodology

Each of Eskom's power stations produce monthly hardcopy emissions monitoring reports. While the reports do not appear to be standardized, most contain graphs of average daily emissions of SO₂, NO_x, and PM as well as corresponding plant-specific AEL limits.

I reviewed data for 14 of Eskom's 15 coal-fired power stations: Arnot, Camden, Duvha, Grootvlei, Hendrina, Kendal, Komati, Kriel, Lethabo, Majuba, Matimba, Matla, Medupi, and Tutuka. All of these plants have six units, except Camden, with eight units. Kusile was excluded from the analysis, as it did not come online before August 2017.

I also reviewed reports from the three gas powered stations of Acacia, Ankerlig and Gourikwa, but had to exclude them from my analysis: Acacia did not operate during the study period and Ankerlig and Gourikwa did not include daily average emissions in their monthly reports.

Twelve of the 14 reviewed stations are within the Mpumalanga Highveld airshed, which is a "priority area" in terms of the National Environmental Management Air Quality Act, 2004. (The two stations outside the Highveld Priority Area are Medupi and Matimba.) I accepted the reported data as accurate, since I do not have the capability to independently confirm the reported data. I assume that the monitors were being calibrated and maintained as needed, unless explicitly noted.

I counted the number of days from April 2016 through December 2017 where reported emissions exceeded the corresponding AEL limit value (21 recent months for which such data were available).

Occasionally some plants reported emissions as "raw" as well as "final" emissions. I did not consider raw emissions in my analysis. Some plants also reported some exceedances as a violation of Section 30 of the National Environmental Management Act. I did not include such exceedances in my analysis.

Two plants (Ankerlig and Gourikwa) provided monthly reports but without the daily graphs. Thus I was unable to include them in my analysis of the daily emissions exceedances.

I excluded reports where data was copied from another report, which would have added 49 additional exceedances.¹ Where monthly reports replicated data, I considered data from only one of these months – making my analysis conservative. I note that submittal of the exact same reports by a plant for multiple months without any corrections indicates that monitoring and reporting is incomplete and unreliable. Finally, where reports had unreasonably high numbers (Grootvlei April ‘16 and May ‘16, which would have added 114 exceedances), I excluded them, again making my analysis conservative.

Results

Based on my analysis, the power stations reported 3,217 violations of their applicable air emissions license (AEL) limits between April 2016 to December 2017 (21 months).

Power Station	Electricity Generation (MWh) 2016-2017²	Total Exceedances April 2016-Dec 2017	PM	SO2	NOx
Lethabo	22,271,522	620	440	36	144
Matla	20,032,197	598	83	33	482
Matimba	25,610,275	449	0	449	0
Kriel	14,837,902	370	370	0	0
Duvha	16,349,000	249	164	28	57
Kendal	23,183,480	248	246	2	0
Camden	7,763,734	169	52	70	47
Grootvlei	4,545,234	125	48	63	14
Medupi	2,428,262	121	47	74	0
Tutuka	16,028,709	106	16	73	17
Komati	4,123,522	78	51	2	25
Majuba	20,900,760	61	49	9	3
Hendrina	8,919,238	23	0	12	11
Arnot	10,483,060	0	0	0	0
TOTAL		3217	1566	851	800

Table 1. Talled exceedances of PM, SO2 and NOx AEL limits at 13 Eskom power stations from April 2016 to December 2017, excluding clearly repetitive or erroneous reports.

¹ The reports with apparent repetitions were: Grootvlei Oct ‘16: contained September ‘16 content; Grootvlei Nov ‘16: missing NOX graph; Grootvlei Jan ‘17: data was labelled December 2015; Grootvlei April ‘17: labelled both April and May ‘17; Grootvlei May ‘17: identical PDF as April ‘17 labelled both April and May; Tutuka Nov ‘16: identical with Oct ‘16; Tutuka Feb ‘17: identical with Jan ‘17 content; Tutuka Nov ‘17: identical with Oct ‘17 content. These duplicate reports would have added 1 PM and 22 SO2 exceedances at Tutuka, and 4 PM, 9 SO2, and 13 NOx exceedances at Grootvlei, totaling 49 additional exceedances.

² http://www.eskom.co.za/OurCompany/SustainableDevelopment/Documents/FuelConsumpData2010_17B.pdf.

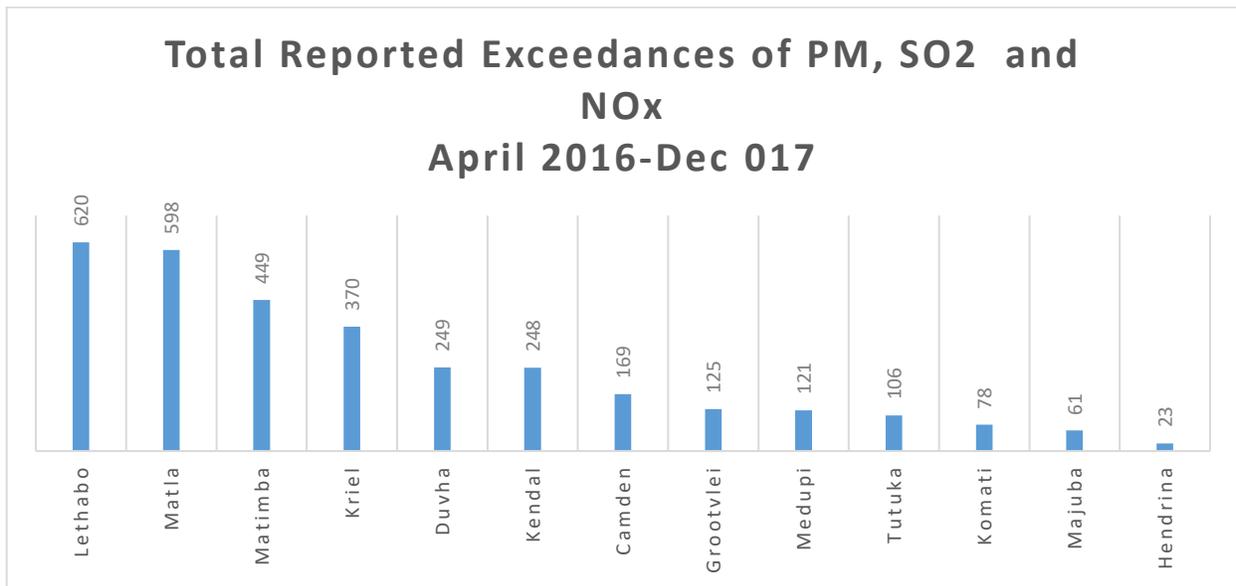

Figure 1. Total reported exceedances of PM, SO₂ and NO_x air emission license (AEL) limits at Eskom power plants from April 2016 to December 2017. Arnot power station reported zero exceedances.

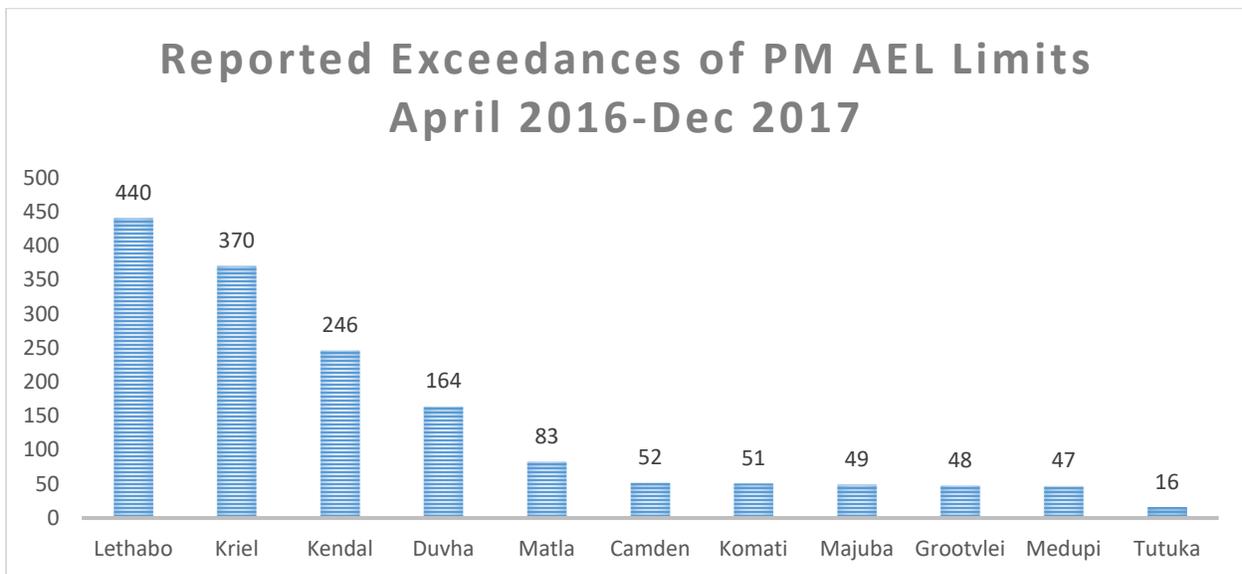

Figure 2. Number of exceedances of PM AEL limits from April 2016 to December 2017. Lethabo, Kriel, Kendal, and Duvha had over 100 exceedances during the study period.

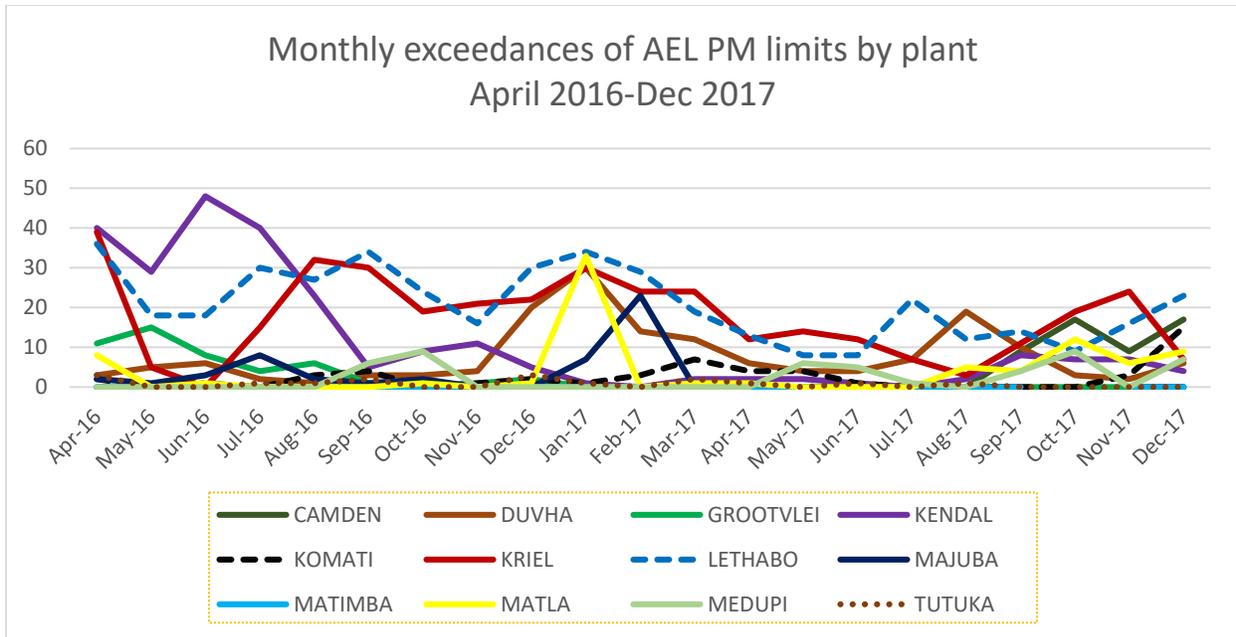

Figure 3. Exceedances of PM AEL limits by plant by month, April 2016 to December 2017. Many plants reported chronic PM limit exceedances for several consecutive months, particularly Lethabo, Kriel, Kendal, Duvha, Matla, Komati, and Majuba.

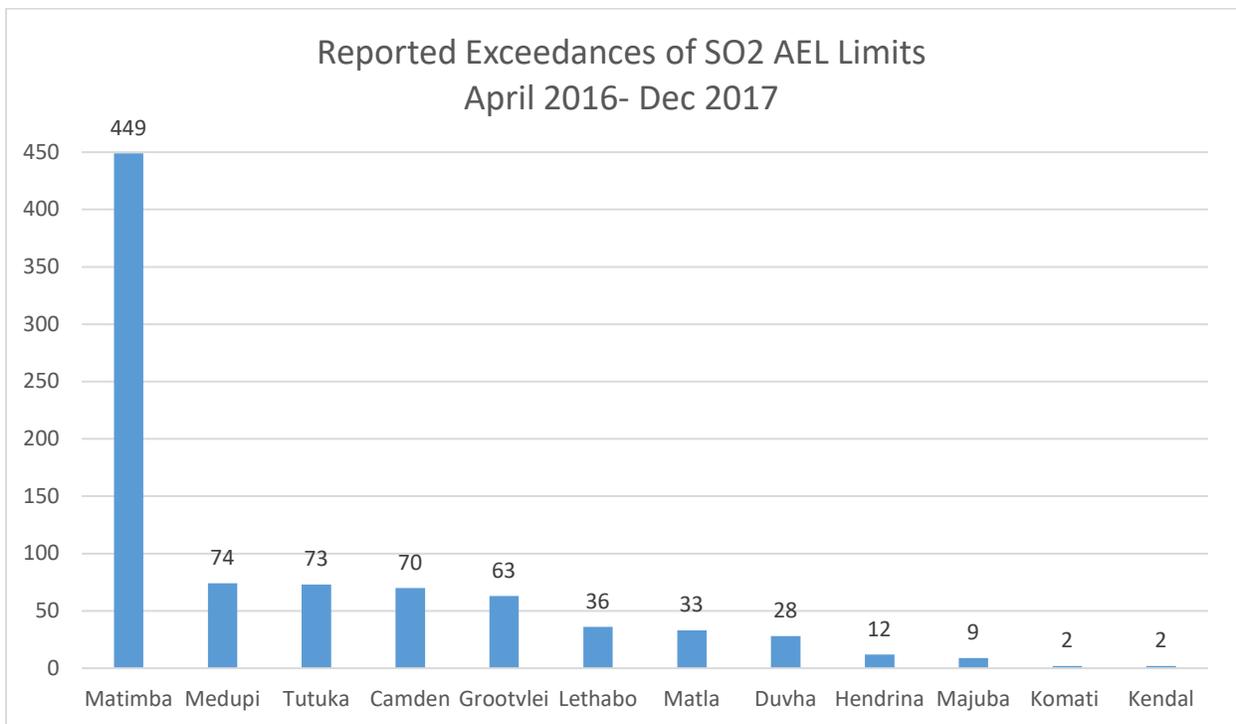

Figure 4. Number of SO2 AEL exceedances from April 2016 to December 2017. Matimba had extremely frequent exceedances.

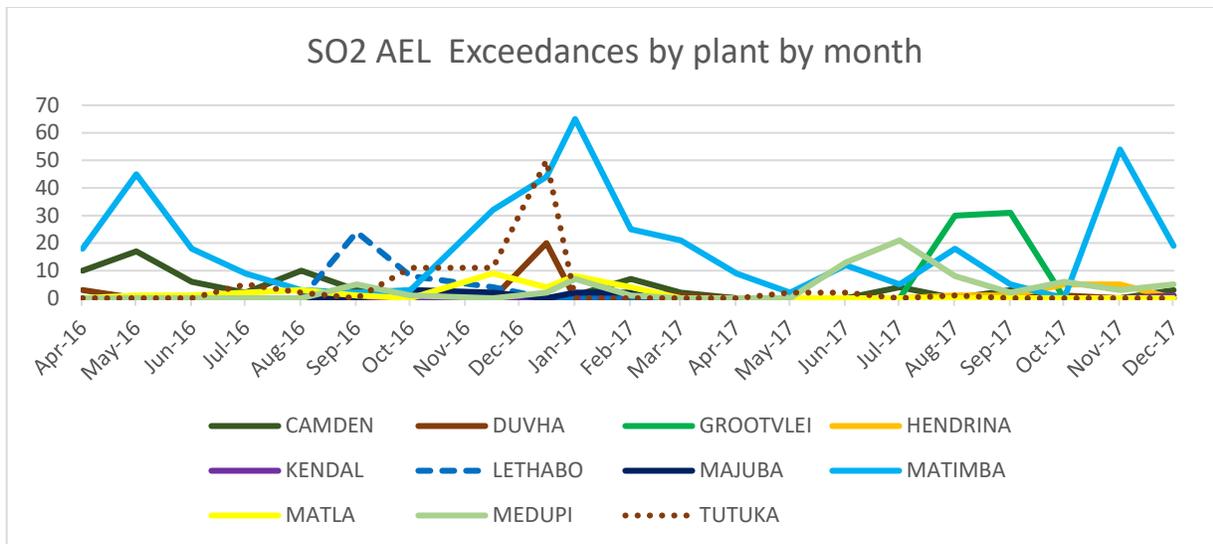

Figure 5. Exceedances of SO2 air emissions limits by plant by month, April to December 2017. Many plants reported chronic SO2 limit exceedances for several consecutive months, particularly Matimba, Tutuka, Matla and Camden.

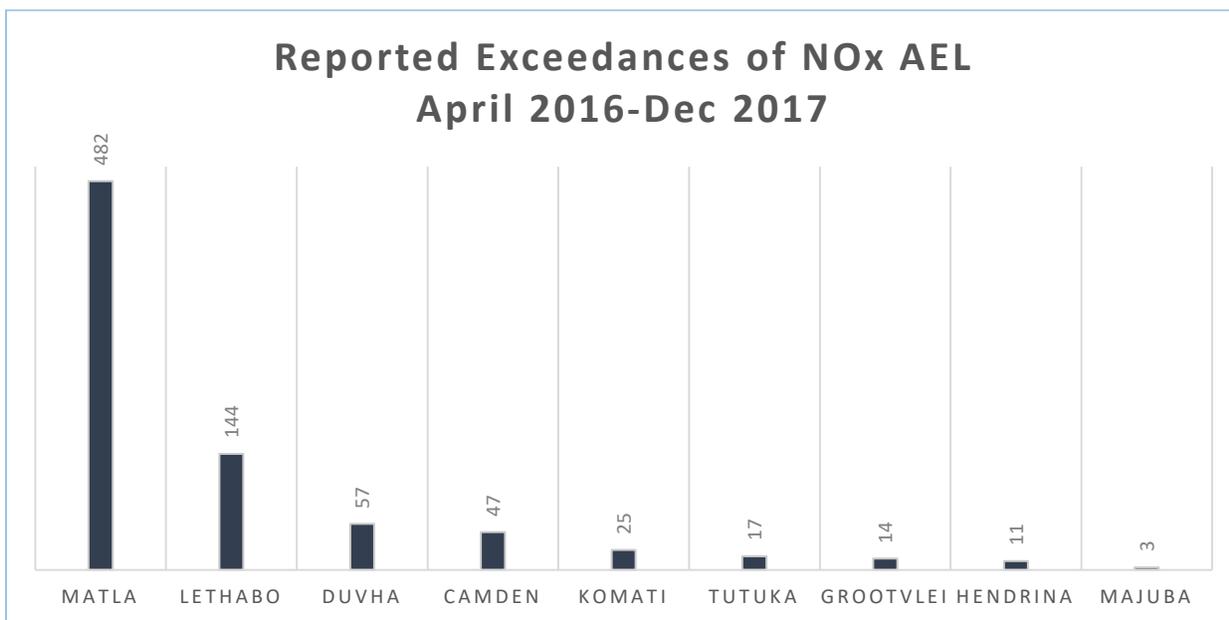

Figure 6. Number of NOx air emissions license (AEL) limits from April 2016 to March 2017. Matla had the highest number of exceedances for any measured pollutant (482).

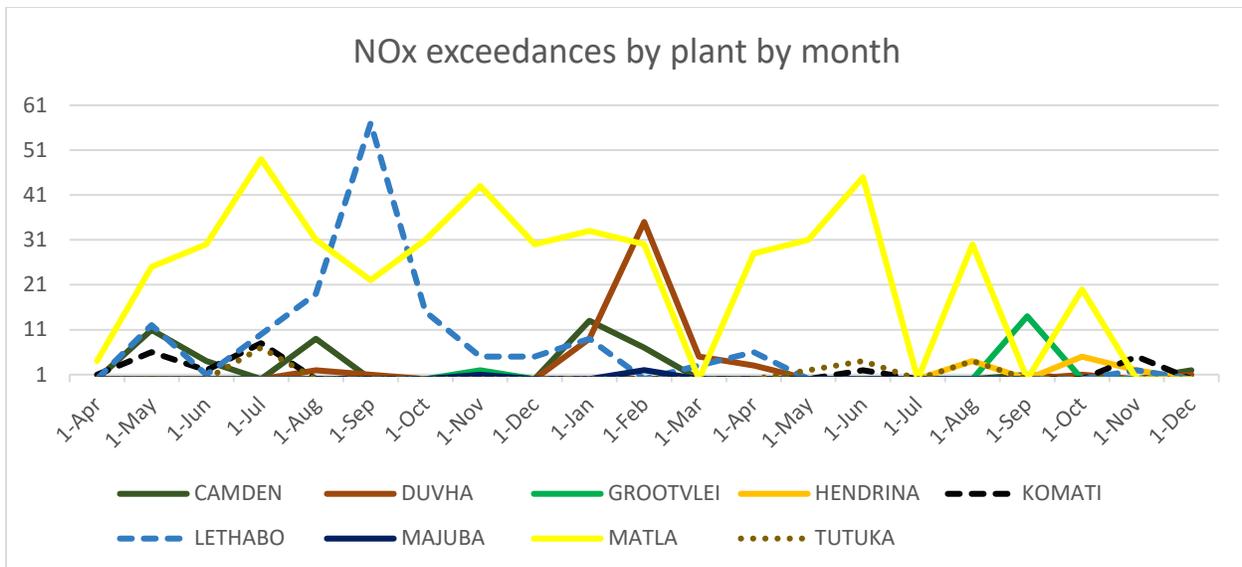

Figure 7. Exceedances of NO_x air emissions limits by plant by month, April to December 2017. Many plants had chronic NO_x limit exceedances many months in a row, particularly Matla, Lethabo, Duvha and Camden and Tutuka.

Findings

First, I note that coal-fired power plants, especially those not equipped with the full suite of modern air pollution controls³ (which is true of the Eskom plants I analyzed) are among the highest emitters of SO₂, NO_x, and PM from all industrial sources, as confirmed in the Highveld Priority Area Air Quality Management Plan (HPA AQMP) and the draft Mid-Term Review of the HPA AQMP reports.

As is clear from my analysis, all of the Eskom coal plants for which I was able to analyze data, except for Arnot, self-report significant numbers of exceedances for at least one pollutant. Many of the plants that generated the most electricity in 2016-2017 also have the most frequent exceedances (see Table 1.) Because the applicable limits in the AELs are quite lax compared to those recommended by the World Bank Group, or those adopted by China, for example⁴, having

³ Best available technologies to reduce air pollution from coal plants include wet flue gas desulphurization to remove 98% of SO₂, low NO_x burners and selective catalytic reduction to remove >95% of NO_x, fabric filters to remove >99% of PM, and activated carbon injection and other systems to remove mercury.

⁴ World Bank/IFC, Environmental, Health, and Safety Guidelines for Thermal Power Plants, Table 6 (May 31, 2017), <https://www.ifc.org/wps/wcm/connect/9a362534-bd1b-4f3a-9b42-a870e9b208a8/Thermal+Power+Guideline+2017+clean.pdf?MOD=AJPERES>. (Table 6 notes that for coal burning power plants over 600 MWth in degraded airsheds, the World Bank recommends limiting PM emissions to 25 mg/Nm³, SO₂ to 200 mg/Nm³, and NO_x to 200 mg/Nm³; China's relevant standards as of January 2017 were 30 mg/Nm³ for PM, and 50-200 mg/Nm³ for SO₂.)

any exceedances of the AEL limits is very troubling. Even perfect compliance with AEL limits allows for discharges of pollution at unhealthy levels. Exceedances are even more troubling since most of these plants are located in area that is already significantly impaired from an air pollution standpoint (e.g., those in the Mpumalanga HPA). There was a high frequency of exceedances of certain pollutants at certain plants. Examples include:

- Lethabo and Duvha had PM exceedances in 100% of reported months (21/21).
- Kriel had PM exceedances in 95% of reported months (20/21). It is also worth noting that Kriel's AEL limit for PM is higher than the 2015 Minimum Emission Standard (MES). I discuss MES further below.
- Kendal had PM exceedances in 90% of reported months (19/21), with up to 48 exceedances in a single month (June 2016).
- Matimba had SO₂ exceedances in 100% reported months (20/20), with up to 65 exceedances in a single month (January 2017).
- Medupi had SO₂ exceedances in 81% of reported months (17/21).
- Camden had SO₂ exceedances in 62% reported months (13/21).
- Matla had NO_x exceedances in 76% of reported months (16/21), with up to 45 exceedances in a single month (June 2017). Matla's AEL limit for NO_x is also higher than the 2015 MES.
- Lethabo had NO_x exceedances in 57% of reported months (12/21), with up to 57 exceedances in a month (April 2017.)

Many plants with frequent exceedances have AEL limits that are higher than the 2015 Minimum Emission Standards (100 mg/Nm³ for PM, 3500 mg/Nm³ for SO₂, and 1100 mg/Nm³ for NO_x). For example:

- Matla's PM limit of 125 mg/Nm³ was exceeded 82 times over the 21 month study period. Its NO_x limit of 1200 mg/Nm³ was exceeded 482 times.
- Kriel's PM limit of 125 mg/Nm³ was exceeded 370 times.
- Tutuka's PM limit of 350 mg/Nm³ was exceeded 14 times.
- Majuba's NO_x limit of 1500 was exceeded 3 times.
- Hendrina's NO_x limit of 1200 was exceeded 11 times.
- Grootveli's PM limit of 350 mg/Nm³ (in 2016) and 200 mg/Nm³ (in 2017) was exceeded 48 times. Its SO₂ limit of 4000 mg/Nm³ was exceeded 63 times. Its NO_x limit of 1700 mg/Nm³ was exceeded 14 times.
- Camden's NO_x limit of 1300 was exceeded 47 times.

Second, in addition to the number of exceedances that I report here, I can state qualitatively that many of these reported exceedances were significantly greater than the applicable AELs. For example, PM exceedances reached at least 500 mg/Nm³ at Duvha and Lethabo, 600 mg/Nm³ at

Kriel, and 1500 mg/Nm³ at Grootvlei. At Grootvlei, 77% of the PM exceedances reached at least 400 mg/Nm³. At Kriel, 47% of PM exceedances were over 200 mg/Nm³.

While that is evident in a simple review of the hardcopy reports, I did not conduct a quantitative analysis of the levels of exceedances because the data underlying the graphic reports was not made publicly available. As I recommend below, electronic reporting of the underlying data would provide a clear ability to conduct such an analysis. This is one of the major shortcomings of the current hardcopy reporting in addition to others noted below.

Third, many of the exceedances are frequent at particular plants as opposed to being sporadic, indicating that the underlying causes of such exceedances are not being addressed by Eskom. To the extent that the purpose of exceedance reporting is to identify the causes of such exceedances, and enable actions to mitigate underlying causes, I do not see evidence of such analysis or actions by the operators. Again, as noted, it is imperative that every effort should be made to eliminate to the greatest extent possible any exceedances in heavily populated areas already impaired by air pollution.

Finally, in one particular aspect, the data that I have presented may be deceptive – specifically for the plants that have reported relatively fewer exceedances. The monthly reports do not contain information to clearly identify if the reason for relatively few exceedances is that the plant in question was operating well below capacity or with some units offline during the month. I recommend below that future monthly reports also provide plant and unit energy production and operating data. This would enable identification of the better-managed plants, normalizing for capacity and energy production factors.

PM exceedances appear to correlate with whether a power station uses fabric filters to control PM emissions, which can reduce PM₁₀ by 99.95% and PM₁ by 99.6%.⁵ Eskom has previously reported that Camden, Komati, Majuba, Grootvlei and Medupi have fabric filters,⁶ but with roughly 50 AEL limit exceedances each in the 21-month study period, the filters may be worn or in need of maintenance. Eskom has reported that Lethabo, Kriel, Kendal, Duvha and Matla do not have fabric filters.⁷ This study shows that these power stations without fabric filters had the most frequent exceedances of their PM AEL limits. As far as controlling SO₂ or NO_x emissions, most of the Eskom plants do not have state-of-the-art controls for these pollutants – i.e., Selective Catalytic Reduction (SCR) for NO_x or some form of flue gas desulfurization (FGD) for SO₂.

⁵ World Bank Group/IFC, Environmental, Health and Safety Guidelines for Thermal Power Plants, Draft for Second Public Consultation, May /June 2017, <https://www.ifc.org/wps/wcm/connect/9a362534-bd1b-4f3a-9b42-a870e9b208a8/Thermal+Power+Guideline+2017+clean.pdf?MOD=AJPERES> at 9.

Recommendations for Reporting

My analysis of plant emissions exceedances was severely limited by inconsistent and unclear reporting. When faced with uncertainty, I gave the benefit of the doubt to Eskom, and so my calculations underrepresent the extent of AEL exceedances. More accurate and comprehensive reporting would significantly enhance government enforcement of AELs and public scrutiny of power plant compliance. To that end, I have the following recommendations:

1. The data should be reported and made available to the public electronically (i.e., in Excel, ASCII or similar format). Using hardcopy reports are not necessary in our time. If needed at all, they should be provided in addition to electronic data. Not only are many of the hardcopy reports difficult to read, they pose an unnecessary hurdle to understanding the ongoing compliance problems at these power plants.
2. In addition to the emissions data, reporting should also include daily energy production data (i.e., MWhr) as well as daily average load levels (i.e., MW). This would provide the ability and context to evaluate the emissions data; and to be able to normalize the emissions data against capacity and energy production. This too should be provided electronically.
3. Emissions as well as energy and capacity data noted above should be provided on a *per unit* basis and not on a *per stack* basis, as is done in many of the current reports. This would provide insight into unit-level emissions performance, where pollutants are actually generated.
4. To the extent that the emissions data are affected by non-normal operating periods – such as startup or shutdown events; or periods that meet Section 30 criteria – these should be clearly and separately noted in the electronic data – including any applicable time windows where such exemptions may apply.
5. To the extent that any of the data are affected by performance issues with the monitoring equipment – i.e., CEMS malfunctions – those should be separately noted in the electronic data files.
6. As noted earlier, the significance of reporting both raw and final emission data is not clear. Any adjustments to raw data that are made by the power plant operator to obtain the final data should be clearly explained and noted in the electronic report. Deviations between raw and final data should be clearly explained.
7. If hardcopy reports are still needed, the format should be standardized. Currently, the types of information reported, the manner in which they are reported, and the degree to which the reported data are properly reviewed – vary between plants. I recommend that the format for each report be made standard including what information should be reported on a mandatory basis (daily emissions, energy, capacity, CEMS malfunction periods, periods of startup and shutdown, Section 30 periods, etc. as noted earlier) or voluntary basis (coal input data, heat input data, etc.). The

format for hardcopy reporting (colored bar graphs for each day per pollutant, clearly legible, separate graphs for each pollutant, etc.) should be specified.

8. Reports with graphs that are clearly erroneous (such as the Tutuka graphs that are copied from previous reports with the month names changed, or the Grootvlei graphs with SO₂ emissions over 300,000 mg/Nm³ and NO_x emissions over 200,000 mg/Nm³) should have been corrected before finalization and publication. It is worrisome that plant operators and regulators in charge of reviewing these monthly reports appear to be neglecting to review reports or require corrective actions for blatant and consistent problems in both reporting and AEL exceedances themselves.

EXPERIENCE SUMMARY

Dr. Sahu has over 30 years of experience in the fields of environmental, mechanical, and chemical engineering including: program and project management services; design and specification of pollution control equipment for a wide range of emissions sources including stationary and mobile sources; soils and groundwater remediation including landfills as remedy; combustion engineering evaluations; energy studies; multimedia environmental regulatory compliance (involving statutes and regulations such as the Federal CAA and its Amendments, Clean Water Act, TSCA, RCRA, CERCLA, SARA, OSHA, NEPA as well as various related state statutes); transportation air quality impact analysis; multimedia compliance audits; multimedia permitting (including air quality NSR/PSD permitting, Title V permitting, NPDES permitting for industrial and storm water discharges, RCRA permitting, etc.), multimedia/multi-pathway human health risk assessments for toxics; air dispersion modeling; and regulatory strategy development and support including negotiation of consent agreements and orders.

He has over 25 years of project management experience and has successfully managed and executed numerous projects in this time period. This includes basic and applied research projects, design projects, regulatory compliance projects, permitting projects, energy studies, risk assessment projects, and projects involving the communication of environmental data and information to the public.

He has provided consulting services to numerous private sector, public sector and public interest group clients. His major clients over the past twenty five years include various trade associations as well as individual companies such as steel mills, petroleum refineries, cement manufacturers, aerospace companies, power generation facilities, lawn and garden equipment manufacturers, spa manufacturers, chemical distribution facilities, and various entities in the public sector including EPA, the US Dept. of Justice, several states, various agencies such as the California DTSC, various municipalities, etc.). Dr. Sahu has performed projects in all 50 states, numerous local jurisdictions and internationally.

In addition to consulting, Dr. Sahu has taught numerous courses in several Southern California universities including UCLA (air pollution), UC Riverside (air pollution, process hazard analysis), and Loyola Marymount University (air pollution, risk assessment, hazardous waste management) for the past seventeen years. In this time period he has also taught at Caltech, his alma mater (various engineering courses), at the University of Southern California (air pollution controls) and at California State University, Fullerton (transportation and air quality).

Dr. Sahu has and continues to provide expert witness services in a number of environmental areas discussed above in both state and Federal courts as well as before administrative bodies (please see Annex A).

EXPERIENCE RECORD

2000-present **Independent Consultant.** Providing a variety of private sector (industrial companies, land development companies, law firms, etc.) public sector (such as the US Department of Justice) and public interest group clients with project management, air quality consulting, waste remediation and management consulting, as well as regulatory and engineering support consulting services.

1995-2000 **Parsons ES, Associate, Senior Project Manager and Department Manager for Air Quality/Geosciences/Hazardous Waste Groups, Pasadena.** Responsible for the management of a group of approximately 24 air quality and environmental professionals, 15 geoscience, and 10 hazardous waste professionals providing full-service consulting, project management, regulatory compliance and A/E design assistance in all areas.

Parsons ES, **Manager for Air Source Testing Services.** Responsible for the management of 8 individuals in the area of air source testing and air regulatory permitting projects located in Bakersfield, California.

1992-1995 **Engineering-Science, Inc. Principal Engineer and Senior Project Manager** in the air quality department. Responsibilities included multimedia regulatory compliance and permitting (including hazardous and nuclear materials), air pollution engineering (emissions from stationary and mobile sources, control of criteria and air toxics, dispersion modeling, risk assessment, visibility analysis, odor analysis), supervisory functions and project management.

1990-1992 **Engineering-Science, Inc. Principal Engineer and Project Manager** in the air quality department. Responsibilities included permitting, tracking regulatory issues, technical analysis, and supervisory functions on numerous air, water, and hazardous waste projects. Responsibilities also include client and agency interfacing, project cost and schedule control, and reporting to internal and external upper management regarding project status.

- 1989-1990 Kinetics Technology International, Corp. **Development Engineer.** Involved in thermal engineering R&D and project work related to low-NO_x ceramic radiant burners, fired heater NO_x reduction, SCR design, and fired heater retrofitting.
- 1988-1989 Heat Transfer Research, Inc. **Research Engineer.** Involved in the design of fired heaters, heat exchangers, air coolers, and other non-fired equipment. Also did research in the area of heat exchanger tube vibrations.

EDUCATION

- 1984-1988 Ph.D., Mechanical Engineering, California Institute of Technology (Caltech), Pasadena, CA.
- 1984 M. S., Mechanical Engineering, Caltech, Pasadena, CA.
- 1978-1983 B. Tech (Honors), Mechanical Engineering, Indian Institute of Technology (IIT) Kharagpur, India

TEACHING EXPERIENCE

Caltech

"Thermodynamics," Teaching Assistant, California Institute of Technology, 1983, 1987.

"Air Pollution Control," Teaching Assistant, California Institute of Technology, 1985.

"Caltech Secondary and High School Saturday Program," - taught various mathematics (algebra through calculus) and science (physics and chemistry) courses to high school students, 1983-1989.

"Heat Transfer," - taught this course in the Fall and Winter terms of 1994-1995 in the Division of Engineering and Applied Science.

"Thermodynamics and Heat Transfer," Fall and Winter Terms of 1996-1997.

U.C. Riverside, Extension

"Toxic and Hazardous Air Contaminants," University of California Extension Program, Riverside, California. Various years since 1992.

"Prevention and Management of Accidental Air Emissions," University of California Extension Program, Riverside, California. Various years since 1992.
